

Know before you enter.

A fire-safety compliance platform that turns paper audits into a live, public readiness signal — for every building, in the hands of everyone.

A building can look perfectly fine and still be a death trap.

In India, fatal fires recur in exactly the places people trust most — schools, hospitals, coaching centres, hostels, malls. The safety equipment often exists on paper. Whether it actually **works today** is invisible — to regulators, and to the person walking through the door.

- **Audits die on paper**

A fire NOC is a one-time PDF in a drawer. No one can tell if a hydrant works this month.

- **Enforcement can't scale**

A handful of fire officers cannot physically re-inspect millions of buildings.

- **The public is blind**

The people most at risk have no way to see a building's safety before entering it.

One system, two apps — and a single colour anyone can read.

FireSafe India — the compliance engine

Heads of institutes, fire officers, and contractors register buildings, run fire & electrical audits, and sign off results — no paperwork, roles derived from who's on each building.

FireSafeIndians — public transparency

Any citizen, with no account, sees a building's live readiness before entering — and can report a hazard anonymously, straight to the people who can fix it.

Every building carries one **earned** readiness colour. It only turns green when equipment is **audited and signed** — not when a form is filed.

Trust, because every green is signed.

STEP 1**Register**

Head of institute adds the building and its address from GPS.

**STEP 2****Set up**

Nodal fire officer pins the location and lists every asset — floor by floor.

**STEP 3****Audit & sign**

Contractor checks each asset and signs with a one-time code. Signed results are immutable.

**STEP 4****Go live**

Working assets turn the building green — instantly visible to the public.

Closing the loop: a citizen's anonymous, GPS-verified concern routes to the fire officer, who pushes it to a contractor — every step tracked, right back to green.

Field-ready compliance, not another form.

01 Roles without admin

Add someone's email to a building and they simply *are* its fire officer — no accounts to provision.

02 OTP-signed audits

An auditor re-verifies identity with a live code before signing. Results are cryptographically fixed.

03 Rolls up the hierarchy

Institutes link under districts and states; owners see every building below them on one map.

Safety you can see — and a voice that reaches someone.

01 Zero-friction

No login, no name, no phone number. Open it and see the buildings around you, colour-coded.

02 Point-and-know AR

Aim the camera at a building; a readiness badge floats over it.

03 Accountable reporting

Concerns are anonymous but GPS-gated to the building, with time-and-location stamped photos.

The rails finally exist — and the pressure is rising.

- **Smartphones everywhere**

Field staff, auditors and citizens all carry the only device this needs. No hardware to deploy.

- **Regulatory tailwind**

Every high-profile tragedy tightens fire-audit mandates. Compliance is moving from optional to enforced.

- **Lean to national scale**

A modern Flutter + Postgres stack lets a small team serve a country — the MVP already runs on cloud infra.

Nobody owns the layer between a building's paper compliance and the public's right to know. **FireSafe India is building it — mobile-first, transparent, and cheap to run at scale.**

Every occupied building is a customer — and India has a lot of them.

Schools, hospitals, malls, offices, hostels and coaching centres are legally required to maintain fire safety. Today most are audited on paper, if at all. Each is a recurring subscription; each fire contractor is a seat; each city fire department is a dashboard.

1.5M₊

schools across India, each with fire-safety obligations

70K₊

hospitals & nursing homes, among the highest-risk occupancies

Lakhs

of malls, offices, hostels & coaching centres under the same mandate

1.4B

citizens — the free side of the network, and its distribution engine

Figures indicative, from public sources · sizing to be refined with the round

Institutions and government pay. Citizens power the network.

● Institution SaaS

Tiered annual subscription per institute — buildings, audit workflow, compliance records and reports.

● Contractor seats

Fire & electrical contractors pay for staff seats and their audit history across clients.

● Government (B2G)

Municipal & state fire departments license live jurisdiction dashboards and the readiness map.

● Citizen app — free

Drives adoption and creates the concern data that makes the institutional product indispensable.

● Compliance reports

Paid PDF compliance certificates & audit trails — a natural per-event upsell.

● Network effect

More buildings → more citizen coverage → more pressure to be listed & green.

LIVE MVP · DEPLOYED

A working product, not a slide.

Both apps are built, deployed to cloud infrastructure, and exercised end-to-end across every role. We are ready for lighthouse pilots — a school district or a city fire department.

- ✓ **Two Android apps, shipping**
Owner/auditor and citizen apps, English & Hindi, installable today.
- ✓ **Cloud backend, live**
Managed Postgres in Mumbai with row-level security and OTP email on our own authenticated domain.
- ✓ **National address system**
155,570-record India postal directory built in — GPS auto-fill anywhere in the country.
- ✓ **Every role proven**
Register → audit → sign → citizen concern → contractor fix, all validated in the running product.

Led by an operator — building the team the round funds.

FOUNDER & CEO

Lt Col Abhishek Yadav

A serving Army officer bringing frontline operational discipline, institutional trust, and on-ground credibility to public safety — the rare founder who has led people through real emergencies.

THIS ROUND FUNDS OUR FIRST KEY HIRES

Head of Engineering

Take the MVP to national scale — reliability, security, data.

Government & Partnerships

Land municipal & state fire departments as B2G anchor customers.

Field Operations

Run lighthouse pilots and onboard institutes and contractors on the ground.

A lean, mission-driven core with the domain credibility to open doors regulators and institutions keep shut to outsiders.

Raising a seed round to turn a working product into a moat.

We're seeking **₹2 crore** to fund lighthouse pilots, harden for scale, and open the government channel. The MVP is done — this round is about proof and reach.

18-month goal: paid pilots in one city and one institution network, SMS OTP + push alerts, and paid compliance reports live.

USE OF FUNDS

Allocation illustrative – to be refined with lead investor

Make every building legible.

The compliance layer that finally reaches the public —
starting in India, built for anywhere fire safety is a promise
no one can currently verify.
